I've been tutoring kids for the SAT-II Math-II test (among other things) and have used the College Board's book for Math-II (only 2 tests), Princeton Review's book (easy - only 2 tests) Barron's Math-I (harder and good prep with review but only 3 tests), Barron's Math-II (even harder but good review and 7 tests), and Dr. Chung's here. Dr. Chung's book is almost all tests (12 tests). There is almost nothing in the way of review of the material and the questions are the hardest of all. Some are so hard that it is difficult to believe anything like them will come up on the real Math-II test which is why I took off 1 star. On the other hand, if you can do all these questions you absolutely, positively know your stuff and can expect a very high score on the real test. You can miss 5-6 questions on the real test and still get 800 which is probably why 11% of the test takers get an 800. If you teach pre-calc or algebra 2 there are some great problems here for extra credit on tests. In prepping students I start with Princeton Review as a kind of light intro, and then the Barron's SAT-I Math-I book since the problems are actually about the difficulty of the real Math-II tests, then the Barron's Math-II book which is harder then the real thing but better to be over-prepared than under. I finish with the real tests. Finally, if they have time and like a challenge we tackle Dr. Chung's book. I like the problems here but some I tell the kids to skip because they won't come up on the test.

This book did nothing to prepare me for the actual SAT II, which was far simpler, but it helped me tremendously in my love for math. I'm taking AP Calc BC this year and reading this book and completing the practice tests the summer before the course began was a great help. I didn't do as well on the SAT II as I would've liked because I didn't pace myself when doing Dr. Chung's practice tests. I justified this with the higher level of his tests as opposed to the real SAT II, but pacing is super important on the Math II. Purchase this book and remember to pace yourself on the tests!

This book is great in sense of teaching you the quick way of solving difficult problems. It helped me a lot because my first math 2c score was 670 but after I bought this book, I got a 790 on the test that was the month after. There are 57 tips and if you study those tips really well, you should be able to score 750+. On the other hand, I found the practice tests in this book really challenging compared to the actual test thus doing all the practice test won't familiarize with the real exam. But it is a really good book.

I just took the SAT Math 2 (October 2014). I have to say, this book is EXCELLENT. Sure there are a couple of typos in the tips section, but I bought this book for the 12 practice tests. The score you get on Chung's is usually lower than your actual SAT score (at least that's what other people are saying...). I can't divulge any info about the SAT Math 2, but I can say that this book is excellent preparation for it. Make sure to buy it early and do ALL of the 12 practice tests.

Absolutely a great book leading you to a perfect score. The review part is especially helpful.

This book includes a large amount of fairly challenging practice tests that I feel prepared me really well for the SAT Math 2 Exam. The tips are also quite useful, but the tests are definitely what makes this book stand out as an excellent SAT prep book. I scored an 800 on the SAT Math Level 2 Exam,

which I felt was about the same level of difficulty as the tests in this book, perhaps a little easier. I highly recommend this book for anyone who wants an 800 (perfect score) on the SAT Math 2 Exam!

Compared with other sat2 books, this one is really the only thing you need to get a perfect score. Although the coverage of this book is far beyond that of real test, if you can missed like 1-3 on this book, i swear you can ace the real thing with 100% correctness. I am not boasting. If you try barron sat math2 or some else (Mcgraw hill, peterson, sparknote idk even easier than regular sat), you will find that only barrons and this one kind prepares you; however, barrons itself misses alot of tips in its review and put everything on its formula sheet.

As a test prep tutor, I've been looking for a good Math Level 2 practice book for a long time. With 12 complete tests and more targeted practice problems, this is a rich source of math level 2-style problems. In other books I have tried, not only were there too few practice tests, but the tests were not similar to the real thing. Sometimes the first test was good, but then the subsequent practice tests deteriorated rapidly. So far I have taken tests 1 and 8. Test 8 required me to apply the Law of Cosines 3 times, which was a bit excessive. Otherwise it was still guite good. I will recommend this for all of my Math Level 2 students. Update: When I read some of the other reviews, I was puzzled by the mention of multiple errors since I hadn't encountered any. I have since attempted to take the 12th test in the book. In test 12, many of the mathematical symbols have been replaced with a square. In most cases I was able to fill in what should be in the squares, but in a few cases I was not. In any event, deciphering the questions slowed me down considerably. Test 12 can be mined for questions, but is not useful as a practice test. This still leaves you with 11 tests which is more than most books offer. As others have pointed out, these tests are more difficult than the actual SAT II Math 2 test I took in March 2013. I consider that to be a good thing. And unlike Barron's, which has questions that are more difficult by means of adding tedious algebra steps, the questions in this book are the same "flavor" as the questions you will find on the real test; they just get more difficult more quickly.
